

RWA TRACK

WORKING PROTOTYPE

AttestFlow

**Turn approved invoices into programmable,
financeable cash flow.**

AI-readable trade evidence. Buyer-authorized payment. USC-verified eligibility. Stablecoin financing and settlement.

SUPPLIER LIQUIDITY

BUYER CREDIT

VERIFIABLE REPAYMENT

Creditcoin CC3 Testnet | Chain ID 102031

REAL TRADE

ON-CHAIN CASH FLOW

Approved revenue is trapped in disconnected systems

A receivable can be economically real yet difficult for a funder to verify, own, and collect.

01 Evidence is fragmented

Contracts, purchase orders, invoices, and acceptance records live across email, ERP, and document silos.

02 Approval is not portable

A database status or PDF confirmation is hard for an external funder to verify independently.

03 Repayment is disconnected

Ownership and settlement records drift apart, increasing reconciliation and double-financing risk.

THE COST OF BROKEN TRUST

SUPPLIERS

Wait for cash already earned

FUNDERS

Underwrite with incomplete evidence

BUYERS

Repeat manual reconciliation

From real trade to repayment in six protocol actions

Each step creates evidence or state that the next participant can verify.

THE MODEL

Approval now

Buyer confirms debt and signs a bounded future payment authorization.

Liquidity now

Funder locks principal; acceptance releases stablecoins to the supplier.

Payment later

At maturity, the contract pays the accepted on-chain funder.

We finance the claim, not a tokenized PDF

The asset originates in commerce and remains linked to its evidence, owner, and cash flow.

WHAT THE CHAIN PROVES

Evidence integrity
Buyer-originated source event
Financing ownership
Escrow and acceptance
Authorization use
Settlement state

WHAT IT DOES NOT CLAIM

A hash is not legal enforceability. An unlocked authorization is not a payment guarantee.

One role-based workspace, four accountable actors

The prototype is not a static mock-up: each role drives a distinct signed or on-chain action.

- SUPPLIER** Create receivables, request financing, accept offers
- BUYER** Confirm payable, sign authorization, publish evidence
- FUNDER** Price buyer risk, escrow principal, receive repayment
- OPERATOR** Monitor proof, authorization, settlement, exceptions

React 19 | TypeScript | wagmi | viem | RainbowKit | PDF.js

USC makes external evidence enforceable inside financing

The proof is not decoration: financing is blocked until CC3 verifies the source event.

ON-CHAIN VERIFICATION CHECKS

OK SOURCE CHAIN

OK SOURCE CONTRACT

OK SUCCESS RECEIPT

OK EVENT FIELDS

OK BUYER = TX SENDER

OK REPLAY KEY

Escrow-backed financing and replay-safe settlement

Each receivable is linked to one supplier, one accepted funder, and one settlement outcome.

01 Proof-gated request

Only USC-verified receivables can enter financing.

02 Principal escrow

The exact principal enters the contract before the offer exists.

03 Supplier-only acceptance

Only the recorded supplier can release funding.

04 Recipient binding

Settlement must pay the accepted funder and face value.

05 Replay protection

Receivable state and authorization hash block duplicates.

06 Operational safety

Allowlist, operators, pause, reentrancy guard, SafeERC20.

DESIGN PRINCIPLE | STATE FIRST, TRANSFER SECOND, EVENTS ALWAYS

Not another upload-invoice-and-mint-token demo

AttestFlow connects evidence, financing ownership, and executable repayment.

TYPICAL DEMO	ATTESTFLOW
NO Invoice hash treated as proof	YES USC verifies the buyer-originated source event
NO Buyer must pre-fund or return later	YES Future-valid authorization; no lock at approval
NO Financing state lives in a database	YES Principal and ownership state live on CC3
NO Repayment goes to a configured wallet	YES Repayment follows the accepted on-chain funder
NO AI output is trusted as truth	YES AI extracts; signatures, proofs, and state establish trust

A working dual-chain prototype, not a concept deck

The repository contains the UI, proof worker, contracts, deployment scripts, and focused tests.

OK ROLE-BASED APP

Supplier, buyer, funder, and operator workflows in React.

OK USC PROOF PATH

Sepolia event to ProofBuilder to native CC3 verifier.

OK FINANCING CONTRACT

Request, escrowed offer, acceptance, and settlement.

OK PAYMENT AUTH

EIP-712 typed data and EIP-3009 authorization.

OK TESTNET TOOLING

Compile, support check, and dual-chain deployment scripts.

3/3 FOCUSED TESTS PASS

Source ABI, USC proof fields, and proof gate validated.

PUBLIC REPOSITORY | github.com/skymiss18/supplychain

Make approved revenue programmable across global supply chains

The hackathon build proves the hardest integration points. Production is a disciplined next step.

01 PROVE THE LOOP

Dual-chain evidence, proof-gated financing, stablecoin disbursement, and repayment.

02 ENTERPRISE READY

Transactional storage, indexed events, KYB/AML, approval policy, HSM-backed relayers.

03 CAPITAL NETWORK

Multiple buyers, funders, stablecoins, jurisdictions, and risk-aware pricing APIs.

THE OUTCOME

Suppliers access liquidity sooner.

Buyers keep payment flexibility.

Funders gain verifiable ownership and repayment.

AttestFlow | Verified evidence to financeable assets to programmable cash flow
